

South Central College

## BIOL 270 Microbiology

### Course Outcome Summary

#### Course Information

**Description** This course is an introduction to the general principles and methods used in the study of microorganisms. It includes a survey of prokaryotic and eukaryotic microorganisms emphasizing bacteria and viruses. Topics include microbial cell structure and function, metabolism, microbial genetics, and the role of microorganisms in disease, immunity and other selected applied areas. Laboratory techniques include isolating, culturing and identifying microorganisms. This course contains a three hour per week laboratory component. (Prerequisites: A grade of C or higher in BIOL115 OR BIOL225 OR BIOL220 AND CHEM108 OR CHEM110) (MNTC Goal Area 3)

**Total Credits** 4

**Total Hours** 96

#### Types of Instruction

Instruction Type	Credits/Hours
Lecture	3/48
Lab	1/48

#### Pre/Corequisites

BIOL115 OR BIOL225 OR BIOL220 AND CHEM108 OR CHEM110

#### Institutional Core Competencies

Communication - Students will be able to demonstrate appropriate and effective interactions with others to achieve their personal, academic, and professional objectives.

Critical and Creative Thinking - Students will be able to demonstrate purposeful thinking with the goal of using a creative process for developing and building upon ideas and/or the goal of using a critical process for the analyzing and evaluating of ideas.

#### Course Competencies

1. **Distinguish between the major classes of microorganisms and understand their respective characteristics.**

### **Learning Objectives**

Distinguish between bacteria, viruses, protozoa, algae and fungi.

Recall the general properties of bacteria, viruses, protozoa, algae and fungi.

Compare and contrast the major categories of microbes.

Identify which types of microbes are most medically relevant and provide examples of these organisms.

## **2. Use the terminology of cell structure and function, cell reproduction, and microbial taxonomy.**

### **Learning Objectives**

Identify the components of Gram negative, Gram positive and Acid fast cell walls.

Compare and contrast the various types of bacterial cell wall including Gram positive, Gram negative and Acid Fast cells.

Identify the major internal cellular structures of a prokaryotic cell.

Compare and contrast prokaryotes and eukaryotes in terms of cell structure and function.

## **3. Describe microbial metabolism.**

### **Learning Objectives**

Explain the key events of glycolysis.

Explain the key events in the Krebs's cycle.

Explain the key events of the Electron Transport Chain and Oxidative Phosphorylation.

Compare and contrast the major energy producing pathways of a microbial cell.

Compare and contrast aerobic and anaerobic respiration.

Compare and contrast respiration and fermentation.

## **4. Explain microbial DNA replication.**

### **Learning Objectives**

Explain the steps involved in DNA replication.

Describe the replication of DNA as a semiconservative process.

Distinguish the leading and lagging strands and how their synthesis differs.

## **5. Explain mutations including their potential causes, consequences and uses.**

### **Learning Objectives**

Distinguish between the forms of point mutations.

Differentiate between a point and frameshift mutation.

Discuss properties of mutagens and materials within the category.

Describe the Ames test for testing for mutagenic properties of a chemical.

Describe light and dark repair of pyrimidine dimers.

## **6. Describe the process of protein synthesis in a prokaryotic cell.**

### **Learning Objectives**

Describe the process of transcription.

Describe the process of translation.

Explain the role of messenger, transfer and ribosomal RNA in the process of translation.

Differentiate between the initiation, elongation and termination stages of translation.

Use a DNA sequence to predict both the RNA and protein sequences.

Explain the use of operons for transcriptional control in prokaryotes.

Contrast the regulation of an inducible operon with that of a repressible operon providing an example of each.

## **7. Explain genetic engineering and its applications.**

### **Learning Objectives**

Define genetic engineering.

Explain various applications of genetic engineering being used in contemporary society.

Interpret a journal article related to genetic engineering.

Evaluate genetic engineering from a natural science perspective and ask questions about evidence to determine the pros and cons of a specific example of genetic engineering.

## **8. Describe horizontal gene transfer in bacteria.**

### **Learning Objectives**

Explain the process of transformation.

Explain the process of transduction.  
Differentiate specialized and generalized transduction.  
Explain the process of conjugation.  
Contrast the major forms of horizontal gene transfer.  
Compare the major forms of horizontal gene transfer.

**9. Describe means of controlling microbial growth.**

**Learning Objectives**

Describe chemical means of microbial control in the environment.  
Describe physical means of microbial control in the environment.  
Describe methods of evaluating the effectiveness of a disinfectant or antiseptic including the phenol coefficient and the use-dilution test.  
Describe means of controlling microbial growth within the body using antimicrobial drugs.  
Describe methods of evaluating the effectiveness of an antimicrobial including the Kirby-Bauer test and the Minimum Inhibitory Concentration test.

**10. Explain the modes of action of antimicrobial drugs.**

**Learning Objectives**

Explain inhibition of cell wall synthesis.  
Explain inhibition of protein synthesis.  
Explain disruption of cell membrane.  
Explain inhibition of metabolic pathways.  
Explain inhibition of nucleic acid synthesis.

**11. Identify the major types of antimicrobial drugs.**

**Learning Objectives**

Identify groups of antibiotics which inhibit cell wall synthesis.  
Identify groups of antibiotics which inhibit protein synthesis.  
Identify groups of antibiotics which disrupt cell membrane function.  
Identify groups of antibiotics which act as antimetabolites.  
Identify groups of antibiotics which inhibit nucleic acid synthesis.

**12. Explain the basic principles of epidemiology.**

**Learning Objectives**

Define epidemiology.  
Distinguish between sporadic disease, epidemics and pandemics.  
Relate portals of entry and exit to modes of disease transmission.  
Distinguish between modes of disease transmission.  
Differentiate between descriptive, analytical and experimental epidemiologic studies.  
Distinguish between common-source outbreaks and propagated epidemics.  
Describe methods of disease control including isolation, quarantine and vector control.  
Identify nosocomial infections and identify means to prevent and control nosocomial infections.

**13. Explain the basic principles of immunology.**

**Learning Objectives**

Identify the types of cells involved in the immune system.  
Identify the role of the various cells involved in the immune system.  
Explain and provide examples of innate and adaptive immunity.  
Explain and provide examples of cell mediated and humoral immunity.  
Compare and contrast the various types of immunity.

**14. Explain the roles that components of the immune system play in preventing and occasionally causing disease.**

**Learning Objectives**

Define and provide examples of Immediate/Type I Hypersensitivity.  
Define and provide examples of Cytotoxic/Type II Hypersensitivity.  
Define and provide examples of Immune Complex/Type III Hypersensitivity.  
Define and provide examples of Cell mediated/Delayed/Type IV Hypersensitivity.  
Define and provide examples of autoimmune disease.

Explain how the immune system causes an autoimmune disorder.  
Describe examples of autoimmune disorders including lupus and rheumatoid arthritis.

**15. Identify infectious diseases including the causative agent and its characteristics, modes of transmission, signs and symptoms as well as treatment of the disease.**

**Learning Objectives**

Identify infectious diseases of the skin and eyes including wounds and bites.  
Identify urogenital and sexually transmitted diseases caused by microbes.  
Identify diseases of the respiratory tract caused by microbes.  
Identify diseases of the oral cavity caused by microbes.  
Identify diseases of the gastrointestinal tract caused by microbes.  
Identify cardiovascular, lymphatic and systemic diseases caused by microbes.  
Identify diseases of the nervous system caused by microbes.  
Integrate course themes as they related to infectious diseases.

**16. Describe the field of applied microbiology.**

**Learning Objectives**

Describe how microbial metabolism can be manipulated for food production.  
Explain how food characteristics and the presence of microbes can lead to food spoilage.  
List several methods for preventing food spoilage.  
List commercial products produced by microorganisms.  
Explain how water for drinking and wastewater are treated to make them safe and usable.

**17. Demonstrate technical laboratory skills such as microscopy, bacterial cell staining, aseptic techniques, culturing and isolation.**

**Learning Objectives**

Use a bright field microscope to view and interpret microbial slides.  
Prepare microscope slides for microbiological examination.  
Perform and interpret a Gram's Stain.  
Perform and interpret an Endospore Stain.  
Demonstrate proper use of aseptic techniques for the transfer and handling of microorganisms.  
Demonstrate the streak plate technique for creation of a pure culture.

**18. Demonstrate proper handling of infectious and biohazardous waste in the laboratory setting.**

**Learning Objectives**

Demonstrate the proper disposal of contaminated lab materials.  
Demonstrate the proper disposal of broken glassware.  
Demonstrate the proper clean up procedure upon finishing a laboratory exercise.

**19. Apply staining and metabolic tests to characterize and identify unknown bacteria.**

**Learning Objectives**

Interpret a dichotomous key.  
Perform the appropriate staining technique(s) to an unknown culture.  
Identify and use appropriate microbiological media and test systems to identify the species of an unknown bacterial organism.  
Write the results of the experiment in a laboratory report.

**20. Enumerate the number of microbes in a sample.**

**Learning Objectives**

Determine the most appropriate means of enumerating the number of microbes based on the type of sample.  
Choose and use the appropriate pipetting device.  
Calculate the number of microbes based on plate counts and serial dilutions.

**21. Evaluate the effectiveness of antimicrobials in the laboratory.**

**Learning Objectives**

Describe the Kirby Bauer method of determining microbial sensitivities.  
Perform a Kirby Bauer test.  
Interpret zones of inhibition and determine the level of microbial sensitivity.

## **SCC Accessibility Statement**

South Central College strives to make all learning experiences as accessible as possible. If you have a disability and need accommodations for access to this class, contact the Academic Support Center to request and discuss accommodations. North Mankato: Room B-132, (507) 389-7222; Faribault: Room A-116, (507) 332-7222.

Additional information and forms can be found at: [www.southcentral.edu/disability](http://www.southcentral.edu/disability)

This material can be made available in alternative formats by contacting the Academic Support Center at 507-389-7222.
